ABSTRACT

[Object]

Provision of a preparing method for the production of a metal micropowder having a uniform diameter which is of value for preparation of precious metal electrodes.

[Invention]

A method for producing a metal micropowder having a uniform particle diameter which is performed sequentially by preparing a colloidal solution which contains two metal (e.g., Ag and Pd) salts having different oxidationreduction potentials; bringing a reducing agent into contact with the colloidal solution, whereby first precipitating micro-particles of a metal (e.g., Ag) having a relatively low oxidation-reduction potential and then depositing a metal (e.g Pd) having a relatively high oxidation-reduction potential on the micro-particles, to produce double layered particles composed of the microparticles of a metal of a relatively low oxidation-reduction potential coated with a metal of a relatively high oxidation-reduction potential; and bringing the colloidal solution containing the double layered particles into contact with a third metal (e.g., Ag-Pd, Pt) salt and a reducing agent.
